Details about Passivity-Based Control of Euler-Lagrange Systems : The essence of this work is the control of electromechanical systems, such as manipulators, electric machines, and power converters.

### Passivity-Based Control of Euler-Lagrange Systems ...

In passivity-based control the main objective is to impose, via the control, the passivity property to some suitably defined map. Under some detectability-like conditions asymptotic stability will then follow. For Euler-Lagrange systems we dispose of a rather systematic procedure to carry out this task.

The fundamental concept of passivity and the perspective of control as a suitable interconnection of the system with its environment are key ingredients in all the developments of the book, which is primarily aimed at control-orientated graduate students and researchers, but which will also have value for both practising engineers and those concerned with the more theoretical side of the subject.

In this paper we survey some recent results on stabilization of nonlinear systems using a passivity approach. In the first part of the paper we treat general systems and develop a unified framework for passivity-based nonlinear control design. In the second part we center our attention on systems described by Euler-Lagrange equations, with particular emphasis on mechanical systems, power converters and AC motors.

Passivity based control is a methodology which consists in controlling a system with the aim at making the closed loop system, passive. The field constitutes an active research direction and therefore in this chapter we give only a basic overlook of the most important concepts involved. A section is also devoted to a wide class of physical

Neuware - The essence of this work is the control of electromechanical systems, such as manipulators, electric machines, and power converters. The common thread that links together the results presented here is the passivity property, which is at present in numerous electrical and mechanical systems, and which has great relevance in control engineering at this time.

In this chapter we describe the class of systems that we will consider throughout the book and which we call Euler-Lagrange (EL) systems. The most important reason for singling out the study of EL systems is that they capture a large class of contemporary engineering problems, specially some which are intractable with linear control tools.
